

IT Service Desk & Infrastructure Handbook

Purpose

This document describes the internal IT support rules for the mock Acme Digital organization. It is reference material for password, account, VPN, hardware, software and security support.

Account and Password Support

Employees should use the company identity portal for password changes. After five unsuccessful login attempts, an account is temporarily locked for 15 minutes. Service Desk may assist with identity verification and account unlock requests. Employees must never share passwords, one-time passwords, recovery codes, or API keys with support staff.

VPN and Network

Remote employees should connect through Acme SecureConnect VPN before accessing internal applications. If VPN fails, confirm internet connectivity, restart the VPN client, and verify that the latest approved client is installed. Persistent failures should be logged with device name, operating system, error message and approximate time.

Hardware and Software

Standard laptops are supported for operating-system and approved-application issues. New software installations require an approved service request. Unsupported or personally installed software may not be installed on company-managed devices without approval.

Security Incidents

Suspected phishing, malware, credential theft, lost corporate devices, or unauthorized access must be reported to the Security Desk immediately. Support staff should not request a user's password or MFA code.
