

Product & Client Success Guide

Purpose

This mock guide covers the AcmeFlow customer platform, product support, release information, SLAs and bug reporting.

AcmeFlow Product

AcmeFlow is a fictional workflow platform used to manage service requests, approvals and customer cases. The Dashboard shows assigned work, pending approvals and recent activity. The Knowledge tab contains approved user guides.

Bug Reporting

A useful bug report contains the feature name, expected behavior, actual behavior, steps to reproduce, browser or client version, timestamp and screenshots when permitted. Severity should be described using business impact rather than personal frustration.

Service Levels

Standard support requests receive an initial response within one business day. Priority incidents affecting a production workflow should be marked as high priority and include the affected service, number of users impacted and business impact.

Release Notes

Product releases are announced through the internal Product Updates channel. Users should review release notes before major workflow changes and report regressions using the standard bug template.
